

Ultraviolet Light Exposure Dosage

(紫外線暴露劑量參考經驗值)

The degree of inactivation by ultraviolet radiation is directly related to the UV dose applied. The UV dose is the product of UV intensity [I] (expressed as energy per unit surface area) and exposure time [T]. Therefore: DOSE = I x T This dose, sometimes referred to as fluence, is commonly expressed as millijoule per square centimeter (mJ/cm²). The units "J/m²" are used in most parts of the world except for North America, where "mJ/cm²" are used.

The reduction of micro-organisms is classified using a logarithmic scale. A single log reduction is a 90% reduction of organisms. A two log reduction is a 99% reduction of organisms, followed by a three log reduction (99.9%), etc. The UV-C exposure dosage needed for each level of reduction is shown in the table along with the published reference where the data came from.

UV Dose (mJ/cm ²) Needed For a Given Log Reduction
